Scope of the project:

Introduction:

Oil India Limited (OIL) is a premier Indian National oil company under the administrative control of Ministry of Petroleum and Natural Gas, Govt. of India, engaged in the business of exploration, development and production of crude oil and natural gas, transportation of crude oil and production of LPG. The Company owns and operates a range of facilities and services required for the above business in the existing concessions. The Company presently produces around 3.5 Million tonnes of crude oil per year, around 7 million m<sup>3</sup>/day of natural gas, and over 50,000 tonnes of LPG per year. Most of this production comes from its traditionally rich oil and gas fields concentrated in the north-eastern part of India and some of the fields are contributing oil and gas for several decades. In addition, OIL holds acreages in other parts of India and other countries, independently/jointly in onshore/offshore.

2.0 Currently OIL is facing challenges in enhancing production from its mature fields due to increase in water cut, cessation of flow and flow assurance issues. In order to accelerate production from existing field and increase chances of success in hydrocarbon discovery, Centre of Excellence for Energy Studies (CoEES) was established with a vision to be a centre of innovation that will steer OIL to be a successful business entity with world class technologies. Currently, the Centre is focusing on Enhanced Oil Recovery (EOR), Petroleum System Modeling, and Unconventional Hydrocarbon Studies. CoEES has been developing industry standard facilities for IOR/EOR studies and aims to be leader in these technologies. In this project, CoEES is looking for collaboration in research with Academic Institutes (Universities/IITs) which have the facilities to accomplish the objectives of the Project and meet its requirements.

Objective:

The focus of this project shall be to enhance the capability of the Centre of Excellence for Energy Studies(CoEES), Oil India Limited (OIL) at Guwahati to perform the chemical and CO<sub>2</sub> EOR flooding schemes to maximize possible recovery of OOIP from the reservoirs in OIL's operational areas.

The following objectives for two (2) reservoirs have to be met in the project:

- Ø Characterization of crude oil, formation water and core samples collected from the field.
- Ø Polymer/Surfactant selection and screening
- Ø Detailed physical and chemical characterizations of the polymers and surfactants chosen for EOR
- Ø Rheology of the selected polymers/surfactant
- Ø Thermal Stability tests of Polymer/Surfactant

- Ø Rock mineralogy/Static Adsorption/ Dynamic Adsorption/Chemical consumption study.
  - Ø IFT Studies with SP, AS and ASP surfactants at ambient temperatures and at BHT.
  - Ø Wettability/ Contact angle/ Imbibition cell studies/ Effect of change of wettability on additional recovery
  - Ø Development of standard operating procedure for lab scale core flooding experiments for chemical (Polymer, AS, SP, ASP) and CO<sub>2</sub> EOR and to standardize the performance of the core flood equipment available at CoEES
  - Ø Development of standard operating procedure of Capillary Pressure and Resistivity for cores using Pc-RI setup available at CoEES
  - Ø Polymer-EOR and other chemical combinations (AS, SP, ASP)-EOR and CO<sub>2</sub>-EOR experiments and data analysis for cores from two reservoirs using equipment available at CoEES
  - Ø Comparison of recovery factors for chemical-EOR and CO<sub>2</sub>-EOR for the selected reservoirs
  - Ø Measurement of Capillary Pressure and Resistivity for cores from two reservoirs using equipment available at CoEES
- Additionally, to document the Standard Operating Procedures for Coreflooding Experiments and Capillary Pressure-Resistivity Index measuring experiments as per the facilities available at CoEES.

### Methodology

The objectives of the projects should be achieved considering a systematic approach towards analyses of the cores/oil/water from the reservoirs from OIL's operational areas. Samples from two reservoirs will be considered to perform the experiments and evaluate the potential of chemical flooding and CO<sub>2</sub> flooding to achieve maximum residual oil recovery under the prevailing reservoir conditions; temperature, pressure, salinity etc. The following methodology should be adopted for each sample.

- Characterization and preparation of the samples:  
Detailed characterization of the field samples; crude oil, reservoir core and formation water should be carried out to simulate the reservoir domain. The samples; crude oil, reservoir rock and formation water will be provided by OIL and the characterization data for each sample should be conducted using the facilities available at the university/institution and at Centre of Excellence for Energy Studies, OIL at Guwahati. Before carrying out experiments in the core samples, the core should be cleaned, saturated, desaturated and aged to attain reservoir conditions and retain its wettability. Several polymers/surfactant applicable to EOR application should be screened by performing various chemical and physical characterizations. Based on the characterization data obtained the comprehensive rheology (stress vs strain data and velocity gradient) of the selected polymers/surfactant should be studied using the facilities available at the University/Institution. The characterization dataset should include the measurement for polymer molecular weight, size and structure (Gel Permeation Chromatography), viscosity (Rheometer), emulsion (Microscope), emulsion stability (Zeta potential), interfacial interaction with crude oil (Spinning drop

tensiometer), thermal stability (degradation using Thermal gravimetric analysis, functional group identification by FTIR, NMR), adsorption behaviour, etc. to assess its suitability for EOR application. Prior to performing the lab scale core flooding experiments each core sample should be subjected to capillary pressure resistivity index (CPRI) measurement instrument (available at CoEES, Guwahati) to determine the water saturation capacity of the core samples at moderate temperature and high reservoir-representative pressure. Based on the analysis of CO<sub>2</sub>- crude mixture properties at various pressure and compositions, phase behaviour analysis of the system should be carried out to determine the minimum miscibility pressure.

- Core flooding studies:

A systematic approach should be adapted to generate the data required for the core flooding experiments. This study should aim the targeted conventional cores (originally collected from the reservoir at different depths) for polymer/surfactant flooding and CO<sub>2</sub> flooding. The core shall be provided by OIL and these shall be prepared by the institution as mentioned above for coreflood studies. Few synthetic core made of sand should also be subjected for the comparative study. The collected core samples without any alteration should be characterized in detail with non-destructive analyses techniques. Knowledge of the capillary pressure distribution which accounts for formation heterogeneity and fluid-fluid-rock relationship is required for the accurate estimation of oil reserve, and for that purpose capillary pressure resistivity index (CPRI) measurements should be performed to establish water saturation relationship. Further, the characterized core samples should be subjected to polymer/surfactant and CO<sub>2</sub> flooding experiments. The experiments with the core samples will follow the standard sequential procedure to measure various parameters such as, absolute permeability, initial water saturation, residual oil saturation, etc. Initial polymer/surfactant flooding experiments should be conducted with selected polymers/surfactant. Further polymer/surfactant-EOR experiments should be performed at reservoir conditions (temperature, pressure, salinity) at different operation conditions (pore injection volume, polymer slug size, etc.). Further, CO<sub>2</sub>-EOR experiments will be performed for different operating conditions (maintaining minimum miscibility pressure and the salinity of the formation water).

- IFT and Adsorption studies:

IFT Studies with SP, AS and ASP surfactants at ambient temperatures and at BHT shall have to be carried out at facilities of University/Institution. The University/Institution shall also carry Rock mineralogy/Static Adsorption/Dynamic Adsorption/Chemical consumption study on the selected core samples for the shortlisted polymer/surfactant.

- Wettability/ Contact angle/ Imbibition cell studies/ Effect of change of wettability on additional recovery studies shall also have to be carried out at facilities of University/Institution.

- Post analysis:

The obtained data and samples (flooded core samples and collected liquid samples) from the polymer/surfactant flooding and CO<sub>2</sub> flooding under various

## **E-TENDER CGI 0316 P19**

conditions should be analysed to estimate the stage wise and overall recovery of OOIP; oil recovery factor, sweep efficiency, mobility ratio, etc. The core samples at each stage should also be analysed to estimate the effects of flooding on reservoir properties, including the adsorption characteristics.
